

Guess Which One Has Lost The Most?

(Emissions, That Is.)

Go "Clean and Green" by running Lean with the EGC

By running your engine in lean burn mode, we can normally meet new EPA emissions requirements without the addition of a catalytic converter. Running lean also saves fuel, extends engine life, and even reduces CO₂.

Maintain Continuous Emissions Compliance Even With Changes in Load or Speed

By integrating an advanced mixing venturi not only does the EGC Improve air and fuel mixing, but it helps to ensure emissions compliance even with big changes in load.

EGC2 & EGC4 Electronic Carburetors

*Reduced emissions
for small and large engines*

Simply the Best Available

When even more stringent emissions reduction is required, the EGC can be used with a catalytic converter to obtain the lowest possible emissions from a gas engine. And the EGC offers on-board diagnostics to help ensure long term compliance. Compare it to other systems on the market and you'll agree it's the best available control technology.

Call Today!

Our sales and engineering staff will be happy to assist you. Make the EGC part of your new commitment to a cleaner, greener, (and possibly leaner) gas engine!
